

Rapid Antigen tests

Quick & Accurate

Infectious diseases testing in rapid test had been built on the principle of detecting the **antibodies** formed by the human body against the foreign infectious agents. But, since most of the tests are not differentiating between IgG and IgM antibodies, most rapid tests had failed to distinguish between recent and old infections. Based on this, the need of a more precise rapid method for detecting the infectious disease in human body had been raised.

Antigen testing had emerged as a solution to provide the user with a more precise diagnosis of the disease and also to monitor the treatment progress.
